

Volunteer Recruitment Notice

Investigational Two-System Hair & Scalp Therapy Evaluation

This investigational project originated as a proprietary formulation developed for hair and scalp health. Following preliminary observational feedback related to hair quality, density, shaft caliber, and pigmentation, the formulation has progressed into a structured research evaluation.

We are recruiting **50–60 volunteers** to participate in an evaluation of a novel **two-system topical hair and scalp therapy** designed to support follicular biology through a dual-phase protocol.

- A daily leave-on system supporting follicular signaling and cellular activity
- A regenerative system applied several times per week to support repair, inflammation modulation, and follicle resilience
- Designed to support hair density, shaft quality, scalp comfort, and pigment biology

Study details:

Location: Scottsbluff, Nebraska (in-person visits)

Study duration: Approximately 6 months

Visit length: Approximately 30 minutes per visit

Compensation: None

Inclusion criteria: Adults 18–60 years of age, male or female, who **self-identify as experiencing** increased hair thinning, increased hair shedding, or decreased hair growth or reduced hair density. Participants must be willing to adhere to the study application protocol and attend scheduled in-person follow-up visits.

Exclusion criteria: Individuals with a known history of autoimmune skin or scalp disorders, active scalp inflammation or infection, or a prior adverse or allergic reaction to topical hair or scalp products.

This is a **non-FDA-approved investigational research protocol**. It is not a medical treatment and is not intended to diagnose, treat, cure, or prevent any disease. All formulation details and methodologies are proprietary and will not be disclosed.

Participation is voluntary. Participants may withdraw at any time without penalty.
